L11 ANSWER 12 OF 18 CAPLUS COPYRIGHT 2008 ACS on STN
AB Suspension methods and compns. for effecting large-scale in vitro differentiation of mammalian embryonic stem cells are provided, as well as methods comprising the subject large-scale in vitro differentiation methods.

L11 ANSWER 13 OF 18 CAPLUS COPYRIGHT 2008 ACS on STN
AB The present invention provides compns. and methods for human neural cell production. More particularly, the present invention provides cellular differentiation methods employing amphiphilic lipid compds., preferably ceramide analogs of the β -hydroxyalkylamine type and optionally employing an essentially serum free MEDII conditioned medium for the generation of human neural cells from pluripotent human cells. The methods alternatively comprise modulating apoptosis by modifying the levels of PAR-4, with or without the presence of amphiphilic lipid compds. and optionally employing MEDII conditioned medium. The methods alternatively encompass modulating apoptosis by modulating the intracellular concentration of endogenous lipid second messengers, such as ceramide. The neural cell of the invention can be used for therapy of a neural disease.

L11 ANSWER 14 OF 18 CAPLUS COPYRIGHT 2008 ACS on STN
AB The present invention provides compns. and methods for human neural cell production. More particularly, the present invention provides cellular differentiation methods employing an essentially serum free MEDII conditioned medium, together with SSEA4 selection and protease passaging

techniques for the generation of human neural cells from pluripotent and multipotent human stem cells. Formation and characterization of embryoid bodies from human embryonic stem cells in serum-free conditions is shown. The invention provides a method of treating a patient with a neural disease by administering a therapeutically effective amount of the neural cells produced using the methods of the invention.

L11 ANSWER 15 OF 18 CAPLUS COPYRIGHT 2008 ACS on STN

AB A method is provided for screening a drug for memory disorder caused by Alzheimer disease or else. The method is characterized in that it comprises performing suspension culture of embryonic stem cells in the presence or absence of Noggin protein to form embryoid body, performing suspension culture of embryoid body in the presence of fibroblast growth factor and sonic hedgehog protein to make nerve stem cell proliferate, producing cholinergic neuron by differentiation in the presence of a test substance, and selecting the test substance effecting on differentiation/proliferation of cholinergic neuron. Alternatively, a test sample is added in the replacement of at least one kind from Noggin protein, fibroblast growth factor and sonic hedgehog protein.

L11 ANSWER 16 OF 18 CAPLUS COPYRIGHT 2008 ACS on STN

AB A method of producing neural progenitor cells and/or neuronal cells which method includes providing a source of pluripotent cells; a cell aggregate-inducing culture medium; and a neural inducing supplement; culturing the pluripotent cells in the cell aggregate-inducing culture medium, in the presence of the neural inducing supplement, for a period sufficient to permit cell aggregates or embryoid bodies (EB's) to form, wherein the EB's include neural progenitor cells; and culturing the cell aggregates including neural progenitor cells for a period sufficient to permit neuronal differentiation.

L11 ANSWER 17 OF 18 MEDLINE on STN DUPLICATE 3

AB Use of fibroblast cells derived from mouse embryos as feeder layers was one of the major steps leading to the establishment of pluripotential mouse embryonal stem (ES) cells in culture. In attempts to obtain a culture of pluripotential ES cells from zebrafish, a culture of fibroblastoid cells, designated zebrafish embryo fibroblast (ZEF), was established from early gastrula stage zebrafish embryos for use as feeder layer. In primary cultures initiated from early embryos of zebrafish without feeder layers, melanocytes appeared on the second day of culture. In contrast, melanogenesis was markedly suppressed in cocultures containing confluent monolayers of ZEF or Buffalo rat liver (BRL) cells. BRL cells are commonly used feeder layer cells for mouse ES cells. Suppression of melanogenesis was not observed in primary cultures initiated in medium containing human recombinant differentiation-inhibiting activity (DIA) or in medium conditioned by cultures of BRL feeder cells. Proliferation of zebrafish embryonal cells was enhanced significantly in cocultures with either feeder layer. Zebrafish embryonal cells cocultured short-term on ZEF and BRL feeder layers gave rise to melanocytes and formed embryoid body-like structures when removed from feeder layers and cultured in suspension, suggesting that the cells remained pluripotent in culture.

L11 ANSWER 18 OF 18 BIOSIS COPYRIGHT (c) 2008 The Thomson Corporation on STN

AB In vitro suspension cultures of embryonal carcinoma or embryonic stem cells (EC/ES) generate cell aggregates

termed as embryoid bodies (EBs). EBs have been analyzed to study the mechanisms of cellular differentiation in vitro. The multipotency of EC/ES cells to differentiate into various cell types as well as the expression of many marker genes provides a valuable in vitro model system to study the mechanisms of cellular differentiation. Here we present a procedure for a mRNA detection of a specific gene using double labeling-mRNA probe and an antibody against cellular marker proteins. This double labeling analysis in combination with a culture of EBs provides a useful approach to analyze several mechanisms of cellular differentiation from multipotent EC/ES cells.
